

Information about the programme of **Multiprofessional Cooperation in Stroke Management**

In the first week we will focus on “MDI’s”. MDI stands for multi-disciplinary interaction. It is a meeting in which information about a patient is exchanged, and decisions about for example the diagnostics or treatment are made.

You start with giving and receiving information about different professions that treat stroke patients: what does a medical doctor, physiotherapist, occupational therapist, speech-language therapist, nurse etc. do with stroke patients?

We need a common language to talk about patients. Therefore we use the ICF-model. We will discuss four patients in different MDI’s.

Many professionals, who work with stroke patients every day, will give lectures about stroke treatment in the Netherlands, and their vision on multi-professional care.

During the second week, we focus on ethics. You will find out, that ethics are very important in our view to the best care we can provide. Intercultural differences will be one of the topics.

You will interview stroke patients, who are in the chronic phase, and are willing to tell you about their experiences in daily life after stroke. This broadens and deepens the knowledge about the disabilities and handicaps the patient and care givers have to deal with, but as well the way they cope with it.

There are some more lectures about special topics around stroke management, like the risk of falling, communication and depression.

You will end the summerschool with receiving your certificate.
